## 6 Front brake disc - inspection, removal and installation

### **Note:**

Before starting work, refer to the note at the beginning of [Section 4](#) concerning the dangers of asbestos dust.

### Inspection

### **Note:**

If either disc requires replacement, BOTH should be replaced at the same time, to ensure even and consistent braking. New brake pads should also be installed.

1 Apply the parking brake, then jack up the front of the car and support it on axle stands. Remove the appropriate front wheel.

2 Slowly rotate the brake disc so that the full area of both sides can be checked; remove the brake pads if better access is required to the inboard surface. Light scoring is normal in the area swept by the brake pads, but if heavy scoring or cracks are found, the disc must be replaced.

3 It is normal to find a lip of rust and brake dust around the disc's perimeter; this can be scraped off if required. If, however, a lip has formed due to excessive wear of the brake pad swept area, then the disc's thickness must be measured using a micrometer (see illustration) . Take measurements at several places around the disc, at the inside and outside of the pad swept area; if the disc has worn at any point to the specified minimum thickness or less, the disc must be replaced. Otherwise, it can be refinished by an automotive machine shop.

### 6.3 Measuring the brake disc thickness with a micrometer

4 If the disc is thought to be warped, it can be checked for run-out. Use a dial indicator mounted on any convenient fixed point and slowly rotate the disc (**see illustration**) . If the measurements obtained are at the specified maximum or beyond, the disc is excessively warped and must be machined or replaced; however, it is worth checking first that the hub bearing is in good condition (Chapters **1** and/or 10).

### 6.4 To check disc runout, mount a dial indicator as shown and rotate the disc

5 Check the disc for cracks, especially around the wheel bolt holes, and any other wear or damage, and replace if necessary.

## Removal

6 Unscrew the two bolts securing the brake caliper mounting bracket to the steering knuckle, then slide the caliper assembly off the disc. Using a piece of wire or string, tie the caliper to the front suspension coil spring, to avoid placing any strain on the hydraulic brake hose.

7 Use chalk or paint to mark the relationship of the disc to the hub, then remove the screw securing the brake disc to the hub, and remove the disc (**see illustrations**) . If it is tight, lightly tap its rear face with a rubber or plastic mallet.

**6.7a Unscrew the retaining screw . . .****6.7b . . . and remove the brake disc from the hub**

## Installation

8 Installation is the reverse of the removal procedure, noting the following points:

- A. Ensure that the mating surfaces of the disc and hub are clean and flat.
- B. Align (if applicable) the marks made on removal, and tighten the disc retaining screw to the specified torque.
- C. If a new disc has been fitted, use a suitable solvent to wipe any preservative coating from the disc, before installing the caliper.
- D. Slide the caliper into position over the disc, making sure the pads pass either side of the disc. Lightly oil the threads of the caliper bracket mounting bolts prior to installation, and tighten them to the specified torque setting.
- E. Install the wheel, then lower the vehicle to the ground and tighten the wheel bolts to the specified torque. On completion, repeatedly depress the brake pedal until normal (non-assisted) pedal pressure returns.
