## 7 Clutch pedal - removal and installation

### Note:

A new self-locking nut should be used to secure the clutch master cylinder on installation.

### Removal

1 Working inside the vehicle, release the retaining clips/screws, and withdraw the driver's side lower dash panel (see [Chapter 11](#) ).

2 Where applicable, remove the clutch pedal switch, by depressing the pedal, pulling out the switch red sleeve to its full extent, then squeeze together the two retaining clips and pull the switch from the bracket.

3 Squeeze together the two halves of the end, then press out the master cylinder pushrod pivot pin from the clutch pedal (see [illustration 5.5](#)).

4 Carefully disconnect the return spring from the pedal using a pair of pliers.

5 Remove the two plastic nuts, and place the anti-theft ECM to one side.

6 Pry off the clip securing the pedal to the pivot shaft, then slide to the right, and remove the clutch pedal. Recover the pivot bushings if they are loose (see [illustration](#)).

### 7.6 Pry off the pedal shaft clip

## Installation

7 Before installation of the pedal to the pivot shaft, check the condition of the pivot bushings, and replace if necessary. Apply a little grease to the bushings.

8 Installation is a reversal of removal. Ensure that the clutch switch plunger is fully extended prior to installation.
